

### Features

- Dynamic random access memory  
65536 x 4 bits manufactured using a CMOS technology
- RAS access times 70 ns/80 ns
- TTL-compatible
- Three-state outputs bidirectional
- 256 refresh cycles  
4 ms refresh cycle time
- FAST PAGE MODE
- Operating modes: Read, Write, Read - Write,  $\overline{\text{RAS}}$  only Refresh, Hidden Refresh with address transfer
- Low power dissipation
- Power supply voltage 5 V
- Package PDIP18 (300 mil)
- Operating temperature range  
0 to 70 °C
- Quality assessment according to CECC 90000, CECC 90100 and CECC 90112

### Description

#### Addressing

The UD61464 is a dynamic random access memory organized 65536 words by 4 bits.

FPM facilitates faster data operation with predefined row address. Via 8 address inputs the 16 address bits are transmitted into the internal address memories in a time-multiplex operation. The falling  $\overline{\text{RAS}}$ -edge takes over the row address. After the row address hold time the column address can be applied. The bit pattern that is available at the address outputs during the set-up time and after the falling edge of  $\overline{\text{CAS}}$  is interpreted as row address. During Write the column address is taken over with the falling edge of the control signal  $\overline{\text{CAS}}$ , or  $\overline{\text{W}}$ , whichever becomes active as the last. The selection of one or more memory circuits can be made via the RAS input.

#### Read-Write-Control

The choice between Read or Write cycle is made at the  $\overline{\text{W}}$  input. HIGH at the  $\overline{\text{W}}$  input causes a Read cycle, meanwhile LOW leads to a Write cycle.

Both  $\overline{\text{CAS}}$ -controlled and  $\overline{\text{W}}$ -controlled Write cycles are possible with activated  $\overline{\text{RAS}}$  signal.

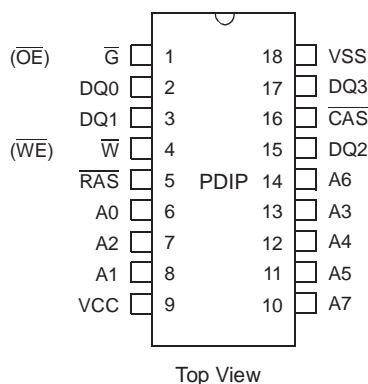

#### Data Output Control

The usual state of the data output is the High-Z state. Whenever  $\overline{\text{CAS}}$  is inactive (HIGH), Q will float (High-Z). Thus,  $\overline{\text{CAS}}$  functions as data output control.

After access time, in case of a Read cycle, the output is activated, and it contains the logic „0“ or „1“.

If the memory cycle is a Read, Read-Write or a Write cycle ( $\overline{\text{W}}$ -controlled), Q changes from High-Z state to the active state („0“ or „1“). After access time, the contents of the selected cell will be available, with the exception of the Write cycle. The output remains active until  $\overline{\text{CAS}}$  becomes inactive, irrespective of  $\overline{\text{RAS}}$  becoming inactive or not. The memory cycle being a Write cycle ( $\overline{\text{CAS}}$ -controlled), the data output keeps its High-Z state throughout the whole cycle. This configuration makes Q fully controllable by the user merely through the timing of  $\overline{\text{W}}$ . Through storing the data on output, they remain valid from the end of access time until the start of another cycle.

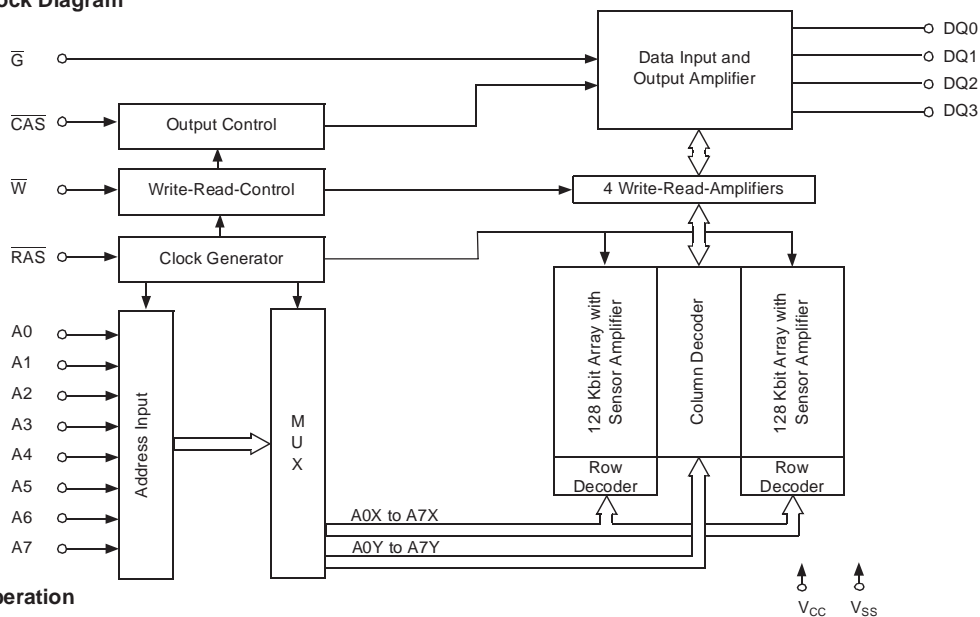

### Pin Configuration

### Pin Description

Signal Name	Signal Description
A0 - A7	Address Inputs
DQ0 - DQ3	Data In/Out
$\overline{\text{W}}$	Read, Write Control
$\overline{\text{RAS}}$	Row Address Strobe
$\overline{\text{G}}$	Output Enable
VCC	Power Supply Voltage
VSS	Ground
$\overline{\text{CAS}}$	Column Address Strobe

## Block Diagram

## Operation

Function		$\overline{\text{RAS}}$	$\overline{\text{CAS}}$	$\overline{\text{W}}$	Address		$\overline{\text{G}}$	Data
					R	C		
Stand-by		H	X	X	X	X	X	High-Z
Read		L	L	H	Row	Column	L	Output Data
Write		L	L	L	Row	Column	X	Input Data
Read-Write		L	L	H → L	Row	Column	L → H	Output Data/Input Data
FPM Read	1st cycle	L	H → L	H	Row	Column	L	Output Data
	2nd cycle	L	H → L	H		Column	L	Output Data
FPM Write	1st cycle	L	H → L	L	Row	Column	X	Input Data
	2nd cycle	L	H → L	L		Column	X	Input Data
FPM Read-Write	1st cycle	L	H → L	H → L	Row	Column	L → H	Output Data/Input Data
	2nd cycle	L	H → L	H → L		Column	L → H	Output Data/Input Data

HIDDEN Refresh <sup>*)</sup>	Read	L → H → L	L	H	Row	Column	L	Output Data
	Write	L → H → L	L	L	Row	Column	X	Input Data

<sup>\*)</sup> Transfer of Refresh Address required

## Characteristics

All voltages are referenced to  $V_{SS} = 0$  V (ground).

All characteristics are valid in the power supply voltage range and operating temperature range indicated below.

Absolute Maximum Ratings	Symbol	Min.	Max.	Unit
Power Supply Voltage	$V_{CC}$	-0.5	7.0	V
Input Voltage <sup>1)</sup>	$V_I$	-1.0	7.0	V
Output Voltage <sup>1)</sup>	$V_O$	-1.0	7.0	V
Output Current <sup>1a)</sup>	$I_O$	-50	50	mA
Power Dissipation	$P_D$		1	W
Operating Temperature	$T_a$	0	70	°C
Storage Temperature	$T_{stg}$	-55	125	°C

Remarks: see page 7

Recommended Operating Conditions	Symbol	Min.	Max.	Unit
Power Supply Voltage	$V_{CC}$	4.5	5.5	V
Input Low Voltage <sup>1)</sup>	$V_{IL}$	-1.0	0.8	V
Input High Voltage	$V_{IH}$	2.4	5.5	V

Remark: see page 7

Capacitances	Conditions	Symbol	Min.	Max.	Unit
Input Capacitance A0 to A7	$V_{CC} = 5.0$ V $V_I = V_{SS}$ $f = 1$ MHz $T_a = 25$ °C	$C_{I1}$		6	pF
Input Capacitance RAS, CAS, W and $\bar{G}$		$C_{I2}$		7	pF
Output Capacitance DQ0 to DQ3		$C_O$		7	pF

All pins not under test must be connected with ground by capacitors.

Static Characteristics	Conditions	Symbol	Min.		Max.		Unit
			DC07	DC08	DC07	DC08	
Power Supply Current (average value of $\overline{\text{RAS}}$ cycles) <sup>2)</sup>	$t_{cW} = t_{cWmin}$ $t_{cR} = t_{cRmin}$	$I_{CC1}$			70	60	mA
Refresh Current (average value of $\overline{\text{RAS}}$ cycles) <sup>2)</sup>	$\overline{\text{CAS}} = V_{IH}$ $t_{cW} = t_{cWmin}$ $t_{cR} = t_{cRmin}$	$I_{CC2}$			70	60	mA
FPM Current (average value of FPM cycles) <sup>2)</sup>	$\overline{\text{RAS}} = V_{IL}$ $t_{cPG} = t_{cPGmin}$	$I_{CC3}$			50	40	mA
Stand-by Current (TTL Level)	$\overline{\text{RAS}} = \overline{\text{CAS}} = V_{IH}$	$I_{CC4}$			2	2	mA
Stand-by Current (CMOS Level)	$\overline{\text{RAS}} = V_{CC} - 0.2 \text{ V}$ $\overline{\text{CAS}} = V_{CC} - 0.2 \text{ V}$	$I_{CC5}$			1	1	mA
Output High Voltage	$I_{OH} = -5 \text{ mA}$	$V_{OH}$	2.4	2.4			V
Output Low Voltage	$I_{OL} = 4.2 \text{ mA}$	$V_{OL}$			0.4	0.4	V
Input Leakage Current at any input, all other pins = 0 V	$V_I = 0 \text{ V to } 5.5 \text{ V}$	$I_I$	-10	-10	10	10	$\mu\text{A}$
Output Leakage Current Q = High-Z	$V_O = 0 \text{ V to } 5.5 \text{ V}$ $\overline{\text{RAS}} = \overline{\text{CAS}} = V_{IH}$	$I_O$	-10	-10	10	10	$\mu\text{A}$

Remarks: see page 7

Remark: see below

#### Remarks:

- The Input Low Voltage must not drop below -0.3 V for more than 40 ns.
- The total sum of the absolute values of output currents must not exceed 100 mA in case of static application.
- The current is inversely proportional to the cycle time; the max. current is measured in the shortest cycle time.
- For test conditions see test configuration for functional test and clock timing.
- $V_{IHmin}$  and  $V_{ILmax}$  are reference levels for time measurement of the input signals; transition times are measured between  $V_{IH}$  and  $V_{IL}$ .
- $t_{v(CAS)}$  and  $t_{v(G)}$  define the time at which the data output goes to High-Z; this time is not related to any level.
- $t_{RASL-CASLmax}$  and  $t_{v(G)}$  are given as reference points only; they do not represent restrictive conditions.
- The values of  $t_{cWmin}$ ,  $t_{cRmin}$  and  $t_{cRWmin}$  are used for indication of

the particular cycle time in which full function is guaranteed in the temperature range from 0 to 70 °C. Values below the one shown above may cause permanent damage to the component.

- Measured with a load equivalent to 2 TTL loads, 100 pF.
- In Read cycle either  $t_{h(RAS-R)}$  or  $t_{h(CAS-R)}$  must be kept.
- $t_{h(RASH-CA)}$  is only required if the valid data are to be held beyond the rising edge of  $\overline{RAS}$ .
- $t_{su(W-CAS)}$ ,  $t_{RAS-W}$ ,  $t_{CAS-W}$  and  $t_{(CA-W)RW}$  do not represent restrictive parameters:
  - if  $t_{su(W-CAS)} \geq t_{su(W-CAS)min}$  and  $t_{h(CASH-W)} \geq t_{h(CASH-W)min}$ , the cycle is a Write cycle (CAS-controlled), and the data output remains in High-Z throughout the whole CAS cycle,
  - if  $t_{CAS-W} > t_{CAS-Wmin}$ ,  $t_{RAS-W} > t_{RAS-Wmin}$  and  $t_{(CA-W)RW} > t_{(CA-W)RWmin}$ , the cycle is a Read-Write cycle, and the content of the cell is available at the data output,
  - if none of these conditions is satisfied, the condition of the data output (at access time) is

indeterminate, since a Write cycle ( $\overline{W}$ -controlled) is carried out.

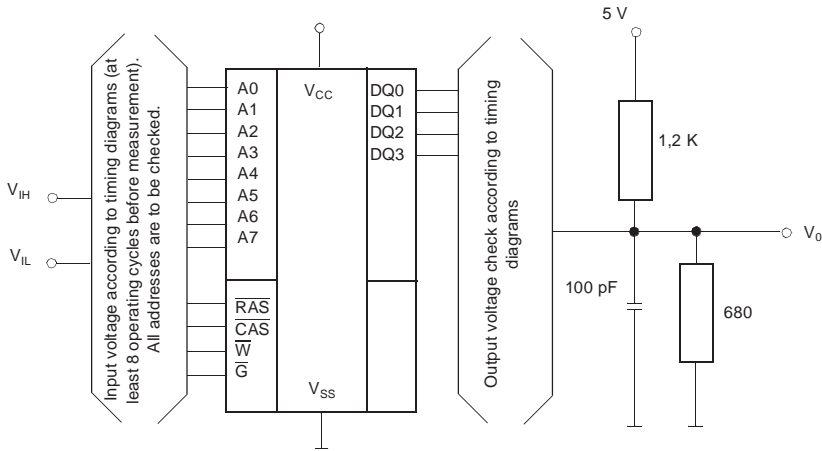

- These parameters refer to  $\overline{CAS}$  during  $\overline{W}$  Write ( $\overline{CAS}$ -controlled), and to  $\overline{W}$  ( $\overline{W}$ -controlled) or to  $\overline{W}$  during Read-Write.
- $t_{su(W-CAS)}$ ,  $t_{RAS-W}$ ,  $t_{CAS-W}$  and  $t_{(CA-W)RW}$  do not represent restrictive parameters:

- if  $t_{su(W-CAS)} \geq t_{su(W-CAS)min}$  the cycle is a Write cycle (CAS-controlled) and the data output remains in High-Z throughout the whole CAS cycle,

- if  $t_{CAS-W} > t_{CAS-Wmin}$ ,  $t_{RAS-W} > t_{RAS-Wmin}$  and  $t_{(CA-W)RW} > t_{(CA-W)RWmin}$ , the cycle is a Read-Write cycle, and the content of the cell is available at the data output,

- if none of these conditions is satisfied, the condition of the data output (at access time) is indeterminate, since a Write cycle ( $\overline{W}$ -controlled) is carried out.

## Test Configuration for Functional Check

## IC Code Numbers

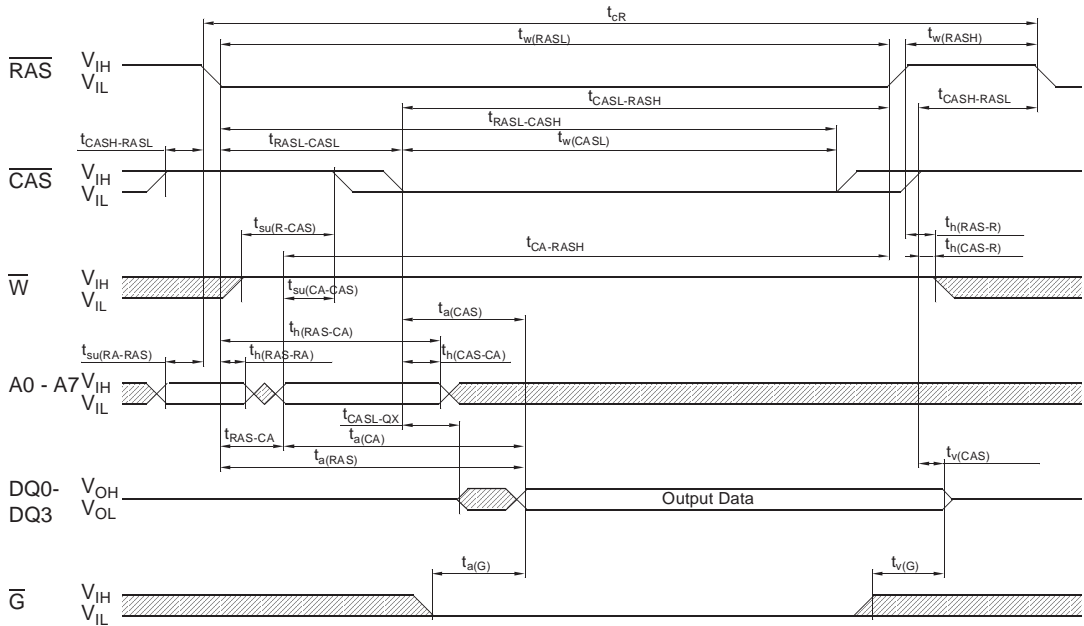

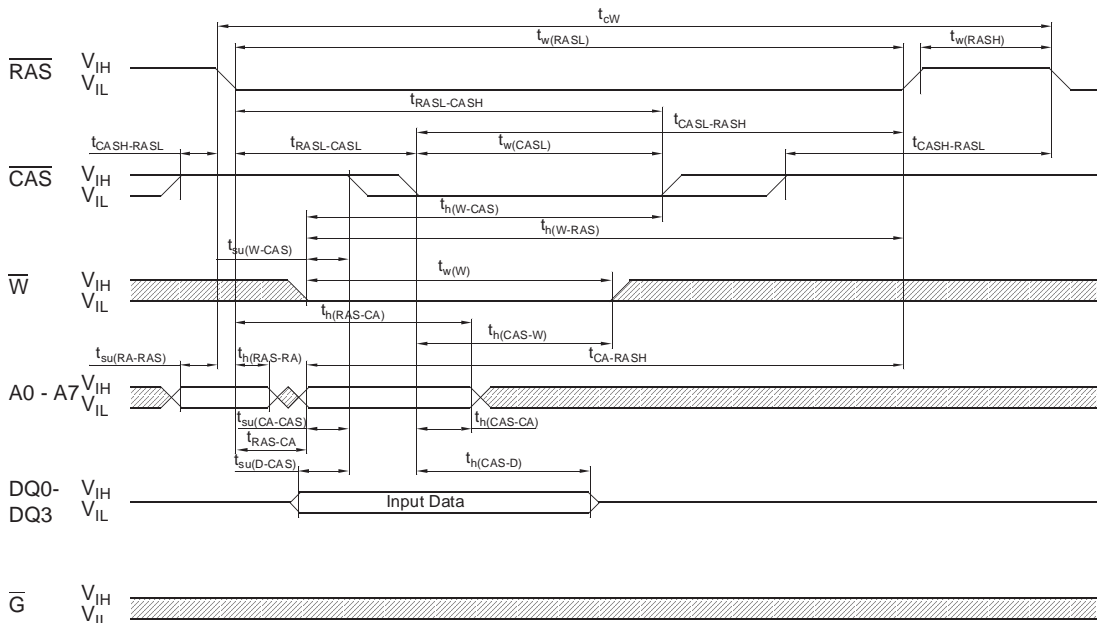

Example

The date of manufacture is given by the 4 last digits of the mark, the 2 first digits indicating the year, and the last 2 digits the calendar week.
