74HC/HCT648

FEATURES

- Independent register for A and B buses
- Multiplexed real-time and stored data
- Output capability: bus driver
- I_{CC} category: MSI

GENERAL DESCRIPTION

The 74HC/HCT648 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT648 consist of bus transceiver circuits with 3-state inverting outputs, D-type flip-flops, and control circuitry arranged for multiplexed transmission of data directly from the internal registers. Data on the "A" or "B"

bus will be clocked into the registers as the appropriate clock (CP_{AB} and CP_{BA}) goes to a HIGH logic level. Output enable (\overline{OE}) and direction (DIR) inputs are provided to control the transceiver function. In the transceiver mode, data present at the high-impedance port may be stored in either the "A" or "B" register, or in both. The select source inputs (S_{AB} and S_{BA}) can multiplex stored and real-time (transparent mode) data. The direction (DIR) input determines which bus will receive data when \overline{OE} is active (LOW). In the isolation mode ($\overline{OE} = \text{HIGH}$), "A" data may be stored in the "B" register and/or "B" data may be stored in the "A" register.

When an output function is disabled, the input function is still enabled and may be used to store and transmit data. Only one of the two buses, A or B, may be driven at a time.

The "648" is functionally identical to the "646", but has inverting data paths.

QUICK REFERENCE DATA

GND = 0 V; T_{amb} = 25 °C; t_r = t_f = 6 ns

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t _{PHL} /t _{PLH}	propagation delay $\overline{A}_n, \overline{B}_n$ to $\overline{B}_n, \overline{A}_n$	C _L = 15 pF; V _{CC} = 5 V	11	11	ns
f _{max}	maximum clock frequency		75	88	MHz
C _I	input capacitance		3.5	3.5	pF
C _{PD}	power dissipation capacitance per channel	notes 1 and 2	30	31	pF

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f_i = input frequency in MHz

f_o = output frequency in MHz

$\sum (C_L \times V_{CC}^2 \times f_o)$ = sum of outputs

C_L = output load capacitance in pF

V_{CC} = supply voltage in V

2. For HC the condition is V_I = GND to V_{CC}
For HCT the condition is V_I = GND to V_{CC} - 1.5 V
