DM74LS90 Decade and Binary Counters

General Description

Each of these monolithic counters contains four masterslave flip-flops and additional gating to provide a divide-bytwo counter and a three-stage binary counter for which the count cycle length is divide-by-five for the DM74LS90.

All of these counters have a gated zero reset and the DM74LS90 also has gated set-to-nine inputs for use in BCD nine's complement applications.

To use their maximum count length (decade or four bit binary), the B input is connected to the Q_A output. The input count pulses are applied to input A and the outputs are as described in the appropriate truth table. A symmetrical divide-by-ten count can be obtained from the DM74LS90 counters by connecting the Q_D output to the A input and applying the input count to the B input which gives a divide-by-ten square wave at output Q_A .

Features

- Typical power dissipation 45 mW
- Count frequency 42 MHz

Ordering Code:

Order Number	Package Number	Package Description
DM74LS90M	M14A	14-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-120, 0.150 Narrow
DM74LS90N	N14A	14-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300 Wide
Devices also available	in Tape and Reel. Specify	by appending the suffix letter "X" to the ordering code.

Bi-Quinary (5-2) (Note 2)

H = HIGH LevelL = LOW LevelX = Don't Care

Note 1: Output Q_A is connected to input B for BCD count.

Note 2: Output Q_D is connected to input A for bi-quinary count.

Note 3: Output Q_A is connected to input B.

The J and K inputs shown without connection are for reference only and are functionally at a high level.

Absolute Maximum Ratings(Note 4)

Supply Voltage	7V
Input Voltage (Reset)	7V
Input Voltage (A or B)	5.5V
Operating Free Air Temperature Range	$0^{\circ}C$ to $+70^{\circ}C$
Storage Temperature Range	–65°C to +150°C

Note 4: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

DM74LS90

 $\label{eq:continued} \begin{array}{l} \textbf{Electrical Characteristics} & (Continued) \end{array}$ Note 8: Q_A outputs are tested at I_{OL} = Max plus the limit value of I_{IL} for the B input. This permits driving the B input while maintaining full fan-out capability. Note 9: Not more than one output should be shorted at a time, and the duration should not exceed one second.

Note 10: I_{CC} is measured with all outputs open, both RO inputs grounded following momentary connection to 4.5V and all other inputs grounded.

Switching Characteristics at V_{CC} = 5V and T_A = 25°C
